

RAVEN

Smart Building Notifications

Introducing R A V E N

RAVEN is a cloud-based smart building notification service that pushes notifications from third-party data sources, including the Niagara Framework, to the Raven Mobile App.

Users can get the building information they need the most, directly on their mobile device in real time.

What if buildings could talk?

DETAILS

Raven brings the smart building information you need the most directly to your mobile device. Send alarms and alerts from the Niagara Framework® to a Raven Server, which then sends push notifications to your iOS or Android device with the Raven app. The Raven app can connect to several different buildings registered to one or more Raven servers, and allows you to choose what kind of push notifications you'd like to receive. Muting notifications will disable push notifications on your device, but still allow you to view your smart building information in the app. Proximity-based push notifications will only enable when you are physically near your building. **Visit www.ctsraven.com for more details and information about this service!**

Buildings vs Homes

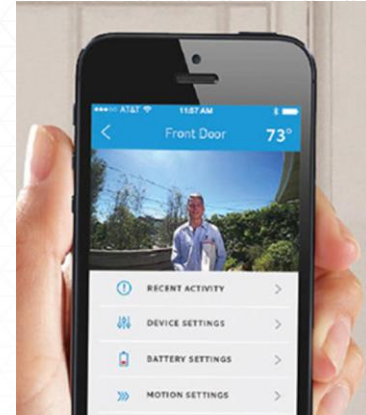

Smart Buildings

Integrate building automation systems including HVAC, lighting, security, and life safety to the internet, with few ways of getting data in real time

Smart Homes

Seamlessly connect devices over the internet to automate and control temperature, lighting, security, entertainment systems, and appliances

R A V E N

- Cloud-based service
- Push only notifications to mobile devices
- Enable proximity-based notifications
- App users can customize their settings
- Include hyperlinks or messages in notifications
- Open REST API for 3rd Party Development
